* Base idea -> Minedustry, Satisfactory mix
  - Base building and TD of Minedustry
  - Production and gathering of Satisfactory
* Core gameplay consists of factory building
* Ground rules
  - 2D random seeded world
  - simple enemies w/o pathfinding (run in a straight line to the core)
  - Factory production consists of multiple steps (miner (ore) -> Furnace (ingot) -> roller (pallets))
* Goals of the game:
  1) Protect the core from enemies
  2) Enlarge the base
  3) Exploit all of the resources.

Must-haves

- Random seeded world with randomly scattered nodes, split into chunks
- Player top-view camera
- Main core and enemies moving straight to the core w/o pathfinding
- Conveyor belts with variable speed
- Node collectors, production buildings and item storage
- Defensive towers

Nice-to-haves

- „Base heat map" to determine the players weakness and spawn enemies there
- Pathfinding weighted by that heatmap
- Tech tree, to unlock global upgrades

Classes

Game

- Calls the WorldGen class to generate the world once
- Manages all the draw calls (60 FPS) 16ms
- Calls the Camera class to update its position (tied to FPS)
- Controlls the main logic in an update() (100 updates per second) 10ms, for example updating conveyor belts, enemy position, production buildings

Camera

- When update() is called move in the direction of the current key presses (WASD)

  * Mouse drag movement?

WorldGen

- generateWorld generates a random world based on the world size given to it
- getters with (x,y) that return the object on that location
- setters with (x,y) that place objects

  # How to incorporate differently sized buildings?
  # Seperate world and building lists?

Block

- updateDraw which need the camera pos to update its screen position, if its on screen, then draw it.

ProductionBlock

- extends Block
- update(), which is called by the Game class
- checkPlacement() checks if it can be placed
